Project Name	AI FAQ Assistant API
Maximum Marks	3 Marks

Define Problem Statements (Customer Problem Statement Template)

The team used the Customer Problem Statement template to understand the perspective of **Priya**, a customer support operations manager who handles a large, repetitive backlog of user inquiries.

PS	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	Priya, a support operations manager handling a large backlog of repetitive customer questions	organize and classify inquiries into a documentation set that stays current	ends up maintaining scattered notes instead of a single structured knowledge base	there is no centralized platform that stores and classifies FAQs by category automatically	behind schedule and unable to see the bigger picture of what customers are asking
PS-2	Priya, trying to resolve queries quickly using keyword or semantic matches against past answers	find the right existing answer in seconds rather than searching manually	has limited visibility into which keywords actually surface a fast, correct match	there is no built-in search layer over the FAQ collection	frustrated by slow query resolution during high-volume periods
PS-3	Priya, drafting complex support answers and new FAQ entries from scratch	publish accurate, well-written answers without spending most of her day writing them	manually drafting every answer is time-consuming and inconsistent across the team	there is no AI layer that can generate a first-draft answer or a full question/answer pair from a topic	overloaded and unable to keep the FAQ set up to date
PS-4	Priya, responsible for keeping private/draft documentation separate from what the public can see	let only the original author edit or delete an FAQ they created	has no unified permission layer, so anyone with access could edit anyone else's entries	there is no authentication/ownership check tying each FAQ back to its creator	concerned about accidental or unauthorized changes to published content
