Project Name	AI FAQ Assistant API
Maximum Marks	8 Marks

Coding & Solution - Implementation Snapshot

Fig. 1 - Actual project folder structure (VS Code Explorer): FAQ/src/{config, controllers, middleware, models, routes, services, utils}, app.js, server.js, .env, and the team's Postman collection Full source is version-controlled and available at https://github.com/sabarivasan-2105/AI_FAQ_Assistant_API. The backend runs on Node.js/Express with MongoDB (Mongoose) and exposes Auth, FAQ and AI route groups, with both AI-generation endpoints isolated behind `services/geminiService.js`.

Representative Endpoint (Create FAQ)

```
POST /api/faqs
Headers: Authorization: Bearer <JWT Token>
Body (JSON):
{
  "question": "How do I configure custom category tags?",
  "answer": "Navigate to settings panel, append keyword tags arrays, and save schema.",
  "category": "Configuration"
}

Response: 201 Created
{
  "success": true,
  "message": "FAQ created successfully",
  "data": { "question": "...", "answer": "...", "category": "...", "createdBy": "<userId>" }
```

The `FAQ` schema's `category` field is validated against a fixed enum (Technology, Education, Health, Banking, General – defaulting to General) at the database layer via Mongoose, so an out-of-range category is rejected before it can be saved, independently of whatever value a client sends (e.g. the "Configuration" example above would be rejected by the schema's `enum` validator in the current model).
